

Outcome tracks the command rate, whoever schedules it

Same axis, completion with 95 % Wilson bands

8088 quarantine-passing flights across 38 arm configurations, gain 0.0055; marker area $\propto$ flights per point. Shaded 25-50 Hz is where the rate-injected envelope climbs out of the floor. Pooled points differ in more than their rate, so they are observational; the joined line is the controlled sweep — one ROS arrangement, goal hold at one camera period, only the rate moving. Greedy schedules are drawn apart: they miss deadlines, so the rate they nominally deliver never reaches the vehicle as usable commands. Rate alone does not rescue them.
