

Every row, both model tiers, against the board

grey band = saturated row: the recurrence has no queue, tier B adds the one named queue term; 0 line = measured on K1

camera → goal error per row

control-rate error per row

■ A · analytical model, submitted inputs (XPU-RT's per-dispatch costs)

◆ B · same recurrence, per-node costs from the board's ROS 2 traces (+ named queue term)

— C · measured on K1 (x axis, or the 0 line)

○ hollow = saturated row
