

XPU-RT derives what ROS 2 needs an expert to hand-build — on gates cleared ahead in 7, level in 6, behind in 0 of 13 paired censuses

ROS 2 draws level when hand-pinned or given a control timer; chained to perception its control rate is its camera's. XPU-RT holds 100 Hz without hand-pinning. Timing measured on the SpacemiT K1, flights in Isaac Sim.

One scene, 36 Hz camera, every recorded run faint, one pair bold:
XPU-RT 4/12 complete, ROS 2 on all 8 harts 0/12

The two schedules on the K1 at 36 Hz: XPU-RT control every 9.9 ms, ROS 2 every 27.8 ms

13 paired censuses, 2184 flights, Isaac Sim with K1 timing

control chained to perception — ROS 2 as normally written

control on its own 100 Hz timer — the expert change

Why: control rate delivered, measured on the K1
